

1. Transcript Extraction

2. Tokenization

Large Language Models (LLMs), such as GPT-3 and GPT-4, utilize a process called tokenization. Tokenization involves breaking down text into smaller units, known as tokens, which the model can process and understand. These tokens can range from individual characters to entire words or even larger chunks, depending on the model. For GPT-3 and GPT-4, a Byte Pair Encoding (BPE) tokenizer is used. BPE is a subword tokenization technique that allows the model to dynamically build a vocabulary during training, efficiently representing common words and word fragments. Although the core tokenization process remains similar across different versions of these models, the specific implementation can vary based on the model's architecture and training objectives.

3. Check Anki Deck

a. Brand new Word

b. Word already exists in deck

Loop back to next word

4. Webscraping for word definition/sentence usage

5. Create word card for Anki Deck

6. Add card to Anki deck
